Abstract

A business has real properties: products, services, infrastructure, people, processes, and characteristics of customer experience.

Yet before purchase, a prospective customer does not see the business in its entirety. They see its public representation: ratings, reviews, photographs, business profiles, management responses, descriptions, third-party publications, and other accessible sources.

At the same time, every customer experience creates substantially more information about a business than usually becomes public. Most of this information remains private and disappears from subsequent choice cycles once that individual experience has ended.

Only part of the experience becomes publicly available information.

When such information remains available to future buyers, the private experience of one customer becomes part of the business's public evidence environment.

A substantial gap may therefore exist between **what a business is in operational reality** and **what is publicly evidenced about it**.

Compounding Public Evidence proposes treating this public evidence layer as a distinct management object.

Its core is not review volume or an aggregate rating, but a structure:

which specific properties of a business are represented by public evidence, how broadly and strongly they are represented, where that evidence originates, on which decision surfaces it is accessible, where gaps exist, and how the structure changes over time.

The framework does not claim that the author invented reviews, electronic word of mouth, reputation, the accumulation of customer experience, attribute-level review analysis, multi-platform presence, or the influence of public experience on subsequent choice.

The proposed contribution lies in combining these elements into one management object:

the Public Evidence Structure of a business, mapped against its Reference Attribute Inventory and described through Coverage, Evidence Strength, Public Evidence Gaps, Surface Distribution, and Public Evidence Dynamics.

1. Two Realities of a Business

Every business has an **operational reality**.

A hotel may actually have a restaurant, spa, casino, parking, conference facilities, family infrastructure, and a particular level of service.

A restaurant may have particular dishes, portion sizes, service speed, packaging, location, and atmosphere.

A clinic may have physicians, equipment, procedures, appointment processes, and specific characteristics of the patient experience.

A prospective customer, however, does not directly observe this entire reality.

Before purchase, they work with the information available to them.

For the purpose of choice, a second reality therefore exists - the **public evidence environment of the business**.

It may represent operational reality reasonably well.

Or it may represent it only partially.

A strong spa may physically exist while being almost absent from recent public evidence.

A hotel restaurant may be a substantial business advantage while a prospective guest can discover almost nothing about it.

Conversely, one negative property may be represented publicly much more strongly than numerous positive aspects of the product.

Compounding Public Evidence begins by recognising this distinction.

2. From Private Experience to Public Information

Every completed transaction or customer experience creates information.

After staying at a hotel, a guest knows substantially more than they knew before arrival.

They may learn:

- how the spa actually works;
- whether the room is quiet;
- whether parking is convenient;
- what the restaurant is really like;
- how staff respond when something goes wrong;
- whether the hotel works well for families;
- whether the photographs match reality.

Most of this knowledge, however, remains **private**.

Once the experience ends, it does not automatically become available to the next prospective customer.

This creates information loss.

Part of the real experience may enter the public environment through:

- a review;
- a photograph;
- a rating;
- a public question and answer;
- an independent description;
- other accessible information.

When this happens, the knowledge no longer belongs only to one past customer.

It becomes capable of participating in future choice cycles.

The value of accumulating Public Evidence arises because information created by past real experience can persist and remain available to people who have not yet made a purchase.

This mechanism itself is not claimed as a new discovery in this Method Note. It is related to earlier work on word of mouth, ZMOT, UMOT, and reputation.

Compounding Public Evidence asks **what exactly persists inside this public layer and how completely it represents the business.**

3. Between Attention and Choice

The commercial journey does not usually end when a person sees an advertisement, a search result, a recommendation, or a brand name.

Attention comes first.

Purchase comes later.

Between them lies **evaluation** - a period in which a person searches for additional information, compares alternatives, assesses risk, and tries to determine which option fits their needs.

This stage has long been described in the Consumer Decision Journey, ZMOT, and other models of buyer behaviour. It is not presented here as a new discovery.

The proposed question is different:

what public evidence structure is available to a person during this period of evaluation?

Advertising, SEO, brand awareness, a personal recommendation, or another channel may bring a prospective customer to a business.

But acquired attention is not yet a choice.

During evaluation, a customer may encounter:

- ratings;
- reviews;
- specific product properties;
- photographs;
- business responses;

- OTAs and aggregators;
- maps;
- the business's own website;
- independent publications;
- information surfaced through search and AI interfaces.

This is where Public Evidence Structure becomes commercially relevant.

The framework does not replace advertising.

It does not replace the product.

It describes the public information environment that participates **between acquired attention and final choice**.

4. Why This Matters to a Business

A business may possess a strong real advantage.

But if a prospective customer cannot easily see, verify, or understand that advantage before purchase, it has fewer opportunities to participate in comparison.

Public Evidence Structure may therefore relate to several practically important mechanisms.

It may:

- reduce uncertainty about specific properties;
- help customers match an offering to their needs;
- allow real business advantages to participate in comparison;
- increase the informational value of attention already acquired;
- help management see the gap between the real product and its public representation;
- increase the amount of specific information available to some search, mapping, and retrieval-based AI systems.

This does not imply guaranteed increases in conversion, ranking, recommendations, or revenue.

A more precise statement is:

Public Evidence Structure defines the quality and completeness of the observable public evidence picture of a business that may be used in pre-purchase evaluation.

5. What Came Before

The idea that the experience of one customer can influence the next is not new.

The Consumer Decision Journey and ZMOT have long described active evaluation before purchase.

UMOT describes the continuation of this cycle: one customer's experience becomes published information for subsequent customers.

Economic literature has long treated reputation as an accumulated market resource and examined the economic value of investments in reputation.

Electronic word-of-mouth research describes digital feedback mechanisms and the transmission of customer information.

Feature-level and aspect-based review analysis have long demonstrated that a single review can contain information about multiple product attributes.

This Method Note therefore **does not claim to have discovered these mechanisms**.

The question here is different:

if public information participates in choice, can we systematically determine which properties of a particular business it evidences - and which properties remain barely evidenced in public?

6. Public Signal and Public Evidence

Not all public information performs the same function.

The framework uses the broader concept of a **Public Signal**.

A Public Signal is any publicly accessible information or observable indicator capable of participating in the perception or evaluation of a business.

A Public Signal may be very general.

For example:

- a business frequently appears in search;
- it has a high rating;
- many people discuss it;
- its profile is actively updated;
- a particular platform contains substantial user-generated content about it.

Such information may matter, but it does not necessarily explain a particular property of the business.

Public Evidence is a narrower class.

Public Evidence is a Public Signal that provides a concrete basis for evaluating a particular property of a particular business entity, or overall satisfaction with an experience.

Thus:

all Public Evidence is a Public Signal, but not every Public Signal is Public Evidence.

A rating of 4.8 may constitute evidence of overall customer satisfaction.

By itself, however, it says relatively little about parking, the spa, the restaurant, or room quietness.

7. From Review Level to Attribute Level

A rating:

5/5

is information and evidence of an overall assessment of the experience.

The statement:

“Excellent hotel.”

adds some information, but remains global.

By contrast:

“The restaurant was excellent, the fish was fresh, parking was convenient but paid, and the children particularly enjoyed the pool.”

contains several distinct claims.

They concern different entities and attributes:

Hotel -> Restaurant -> Food quality

Hotel -> Parking -> Convenience

Hotel -> Parking -> Price

Hotel -> Pool -> Family experience

A single review may therefore contain zero, one, or several independent attribute-level units.

For this reason, a review is treated primarily as a **container** / **carrier** of public information.

The unit of analysis lies inside it.

8. Public Evidence

Within the framework:

Public Evidence is publicly accessible information or an observable claim that provides a concrete basis for evaluating a particular property of a particular business entity or a general characteristic of the experience.

Evidence is always evidence **of something**.

There may be evidence about parking.

Evidence about breakfast.

Evidence about spa cleanliness.

Evidence about portion size.

Evidence about overall satisfaction.

The existence of Public Evidence does not mean that a statement automatically represents objective truth.

Different sources carry different degrees of independence, accuracy, and evidentiary weight.

Public Evidence means, first of all:

that concrete public information exists from which a prospective customer can form an assessment of the relevant property.

9. Evidence Unit

The minimum unit of Public Evidence Structure is an **Evidence Unit**.

An Evidence Unit contains one semantically independent public claim or observation concerning one primary attribute of a specific entity.

For example:

“Parking costs €10 per day.”

This is one Evidence Unit:

Hotel -> Parking -> Price.

The statement:

“Parking is convenient, but it costs €10 per day.”

may contain two units:

Parking -> Convenience

and

Parking -> Price.

A single source item may therefore be divided into multiple Evidence Units without changing its original meaning.

Each unit must remain linked to its original source.

This is necessary for verifiability and preservation of provenance.

10. Provenance

Not all public claims are equivalent.

The framework distinguishes three primary provenance classes.

Customer-generated evidence arises from publicly expressed customer experience: review text, user photographs, and other forms of published experience.

First-party evidence is published by the business itself: service descriptions, product characteristics, menus, business-profile information, the business's own website, and public management responses.

Independent third-party evidence originates from an external source that is not the business itself: editorial publications, independent reviews, professional directories, and other outside sources.

These classes may complement one another, but they should not be conflated.

The business's statement:

"We have an excellent spa."

and numerous concrete guest descriptions of the spa represent different types of evidence.

The framework preserves that distinction.

11. Source and Surface Are Different

It is important to distinguish where information originates from where it is accessible.

Source answers:

who created the claim?

Surface answers:

where can a prospective customer or information system discover it?

For example, a customer may create a review that is displayed on Google Maps.

The source is the customer.

The surface is Google Maps.

A business does not exist within one universal information environment.

Different customers follow different research paths.

Different retrieval systems have different access to sources.

The existence of an Evidence Unit therefore does not imply equal accessibility in every choice context.

12. Surface Distribution

Public Evidence Structure has not only content but also **distribution across decision surfaces**.

Within the framework, this is called **Surface Distribution**.

Surface Distribution describes:

on which relevant surfaces the Public Evidence of a business is accessible to prospective customers and information systems.

Depending on the business category, such surfaces may include:

- maps;
- search results;
- review platforms;
- OTAs and aggregators;
- the business's own website;
- professional directories;
- independent publications;
- other public sources accessible to retrieval systems and AI agents.

The general principle of multi-platform presence is not new.

Review spread, cross-platform reputation monitoring, multi-source aggregation, and review-information syndication are already used in reputation management and hospitality systems.

The proposed role of Surface Distribution is narrower:

it is one dimension of the Public Evidence Structure of a specific business, describing where evidence of specific properties is accessible during evaluation.

The framework does not assume that maximum concentration of information on one platform is automatically optimal.

Distribution matters for at least three reasons.

Different buyers follow different research paths.

Different information systems have unequal access to sources.

Concentrating a large share of evidence on one platform creates **platform-custody risk**: changes in policy, indexing, interface design, or availability may alter the observability of that part of the Public Evidence Structure.

Specific procedures for selecting platforms and distributing operational activity across them are outside the scope of this Method Note.

13. Business Responses as a Separate Layer

A public response from a business is not independent customer evidence.

But it is not informationally neutral either.

A public response may clarify a factual condition, correct outdated information, confirm a change in service, explain an action taken by the business, or demonstrate a response to a problem.

For example, a customer writes:

“Parking is paid.”

The business responds:

“Underground parking costs €10 per day; free municipal parking is available approximately 200 metres away.”

For the next prospective customer, the public information environment has become richer.

But provenance remains clear.

The first statement originates from the customer.

The second originates from the business.

A business response may add context.

It does not thereby become independent confirmation of the business’s own claims.

14. Public Evidence Asset

The accumulated body of publicly accessible evidence about a business forms its **Public Evidence Asset**.

The word asset is not used here in an accounting sense.

The business does not necessarily control this object legally.

Public materials may reside on third-party platforms, be removed, become outdated, become inaccessible to particular systems, or lose relevance.

Public Evidence Asset is a management construct:

an accumulated public information resource, created in part by past customer experiences and capable of participating in subsequent cycles of business evaluation.

Its value is not determined merely by accumulation itself.

What has accumulated matters.

One hundred general positive ratings and one hundred substantive pieces of evidence covering different important business properties do not form the same information structure.

The accumulation of public customer experience itself is not claimed as novel.

The proposed contribution begins with analysing the internal content and structure of this accumulated layer.

15. Reference Attribute Inventory

To determine what is well evidenced and what is poorly evidenced, one must first determine:

what actually exists in the business and which parts matter for choice.

For this purpose, the framework uses a **Reference Attribute Inventory** - a reference set of entities and attributes of a specific business.

Two different questions must be separated.

15.1 What exists?

This is determined by the **operational reality of the business**:

- existing products;
- services;
- infrastructure;
- conditions;
- characteristics of the offering.

If a property is known only from the business's own statement and has not been independently verified, it is recorded as **business-claimed**, rather than as an established objective fact.

15.2 What matters among what exists?

Not every real property matters equally to a prospective customer.

Attribute priority should therefore be determined through **choice relevance** - its significance within the real decision process.

Sources of choice relevance may include:

- the language of demand and search queries;
- customer questions;
- comparison criteria;
- observed buyer behaviour;
- attributes commonly used to compare similar offerings;
- the characteristics of the category and purchase scenario.

Operational reality defines the **space of possible attributes**.

Demand and choice criteria help determine **their priority**.

This prevents the framework from optimising the public visibility of a property merely because the business itself is proud of it.

The framework therefore begins not with:

“What do the reviews talk about?”

but with:

“What is this business, what matters within it for customer choice, and what among those important properties is publicly evidenced?”

16. Public Evidence Structure

Public Evidence Structure is the mapping of a business's Reference Attribute Inventory to existing Public Evidence Units and the surfaces on which those units are accessible.

For each relevant attribute, the structure makes it possible to describe:

- whether Public Evidence exists;
- where it originates;
- how recent it is;
- how specific it is;
- how consistent it is;
- where it is accessible;
- whether counter-evidence exists.

For example, a hotel's Reference Attribute Inventory may contain:

Restaurant -> Food quality

Restaurant -> Variety

Spa -> Cleanliness

Spa -> Equipment

Casino -> Experience

Parking -> Availability

Parking -> Price

Rooms -> Quietness

Family facilities -> Suitability

If the public environment contains detailed evidence about rooms and staff but almost nothing about the casino and spa, this becomes an observable property of the Public Evidence Structure itself.

The object of analysis is therefore not simply feedback.

The object is:

the relationship between important properties of the real business and their public evidentiary representation.

17. Public Evidence Coverage

Coverage answers one question:

what proportion of significant attributes in the Reference Attribute Inventory has qualifying Public Evidence at all?

Coverage is a measure of breadth.

Conceptually:

$$\text{Coverage} = \frac{\text{significant attributes with qualifying evidence}}{\text{all significant attributes in the Reference Attribute Inventory}}$$

Where attributes differ in importance, weighted coverage may be used.

However, weights must be defined before analysis rather than selected after observing results.

Coverage must not be confused with evidence strength.

One old mention may create formal coverage without creating strong public evidence.

For that, a separate concept is required.

18. Public Evidence Strength

Evidence Strength answers:

how strongly is a particular attribute represented by public evidence?

Strength is a multidimensional characteristic.

It may be influenced by:

- volume of evidence;
- recency;
- specificity;
- repetition;
- provenance;
- source diversity;
- consistency;
- presence of counter-evidence;
- accessibility across relevant decision surfaces.

Conceptually:

```
Strength(attribute) =  
f(  
volume,  
recency,  
specificity,  
provenance,  
source diversity,  
consistency,  
counter-evidence,  
surface accessibility  
)
```

The framework defines the dimensions, not universal weights.

Specific rules may vary by business category and must be fixed before measurement.

Semantic classification and numerical calculation should remain separate:

the semantic layer determines meaning; the deterministic layer calculates the result.

19. Public Evidence Gap

A **Public Evidence Gap** is a significant attribute in the Reference Attribute Inventory that either lacks qualifying Public Evidence or is represented by evidence whose Strength falls below a predefined criterion.

Two basic cases may be distinguished.

Absolute Evidence Gap - a significant property is effectively absent from the Public Evidence Structure.

Weak Evidence Gap - evidence exists, but it is too weak, old, one-sided, contradictory, or poorly accessible for the property to be considered robustly represented.

The key distinction is:

a Public Evidence Gap is a visibility gap, not a quality gap.

The absence of strong evidence about a good spa does not mean the spa is poor.

It means:

the public environment provides limited grounds for evaluating that property before purchase.

20. Contradictory Evidence

A separate case arises when substantial evidence conflicts.

For example, older reviews consistently state:

“The rooms are very quiet.”

while newer reviews repeatedly state:

“It is impossible to sleep at night because of the noise.”

The problem is no longer lack of Coverage.

There may be plenty of information.

The problem is low consistency and a change in the evidence picture.

A large volume of evidence therefore should not automatically be interpreted as a strong positive structure.

21. Public Evidence Dynamics

Public Evidence Structure exists over time.

It should therefore be treated not only as a snapshot but as a dynamic object.

This overall change is called **Public Evidence Dynamics**.

Evidence Units appear, repeat, age, become less relevant, conflict with one another, disappear from platforms, or cease to be accessible to particular systems.

Several regimes can be observed.

Compounding - the inflow of fresh evidence that confirms existing properties or expands Coverage consistently exceeds losses caused by ageing, removal, and material contradiction; Coverage and/or Strength increase.

Stagnating - the structure changes very little: new evidence roughly offsets natural ageing or appears only minimally.

Decaying - usable evidence loses relevance, accessibility, or volume faster than the structure is replenished.

Contradicting - new credible Evidence Units increase contradiction and reduce the stability of the previous evidence picture.

Different attributes of the same business may be in different regimes.

The spa may be compounding.

The restaurant may be stagnating.

Parking may be contradicting.

22. Why the Framework Is Called Compounding Public Evidence

Compounding is not a synonym for all dynamics and does not imply guaranteed financial growth.

It is one specific regime within Public Evidence Dynamics.

The name highlights the possibility that:

Public Evidence created in one cycle of real customer experience can remain available for subsequent cycles of choice and be supplemented by new evidence.

This is where the original information loss becomes important.

Most of one customer's experience disappears from the public environment.

But the part that becomes Public Evidence and persists may outlive the completed transaction itself.

New customer experiences may add new Evidence Units to the existing structure.

Such accumulation does not occur automatically.

Evidence may stagnate.

It may decay.

New information may contradict the previous picture.

Compounding is therefore an observable regime, not a promise of outcome.

23. From Measurement to Management

If Public Evidence Structure is only described, the framework remains a diagnostic tool.

Management application begins when a business can see:

- which important properties are well represented;
- which are weakly represented;
- which evidence has become outdated;
- where contradictions exist;
- where a business advantage exists operationally but is almost absent publicly;
- which properties are supported only by the business itself;
- how evidence is distributed across relevant surfaces;
- how the structure changes between repeated measurements.

This creates a basis for decisions intended to make the public information environment more accurately reflect the real business.

This Method Note deliberately does not provide a universal public instruction for specific execution procedures.

Operational procedures used in commercial applications are outside the scope of this note.

24. Independence of Customer Opinion

Managing Public Evidence Structure does not mean managing **what a customer is required to say**.

A customer may have a positive, negative, or mixed experience.

The framework does not imply:

- dictating ratings;
- dictating review text;
- creating an experience that did not occur;
- fabricated reviews;
- review gating;
- suppression of negative experience;
- incentivising predetermined positive content.

The purpose of the framework is not to manufacture a desired reputation.

Its purpose is to measure and work with the public evidence environment while preserving the distinction between independent customer-generated evidence and first-party information.

Specific applications are always constrained by applicable law and the policies of the relevant platforms.

25. Distribution Does Not Mean Duplication

Surface Distribution does not mean that identical information should be artificially reproduced across as many platforms as possible.

The point is different:

important business properties may be accessible on different surfaces used by different people and information systems.

Public Evidence Structure should therefore consider not only:

“Does evidence exist?”

but also:

“Where is this evidence accessible?”

A business may have a large body of evidence concentrated on one platform while having very weak representation across other relevant surfaces.

That is a separate structural property.

26. Point of Choice

Point of choice is used here as a descriptive term, not as a proprietary concept claimed by the author.

It refers to a situation in which a prospective customer is actively considering alternatives and approaching a decision.

This is where the specificity of Public Evidence becomes practically relevant.

A customer may not be satisfied with knowing:

“This hotel has a 4.7 rating.”

They may need to know:

- whether it works for families;
- whether parking is convenient;
- what the spa is like;
- whether the rooms are quiet;
- whether the restaurant is good;
- whether it is suitable for work;
- how the business responds to problems.

Two businesses with identical aggregate ratings may therefore have substantially different Public Evidence Structures.

27. Search, Maps, and AI Retrieval

Public Evidence Structure has a second audience in addition to people.

Some search systems, maps, aggregators, AI interfaces, and agents retrieve and summarise public information about businesses.

Google Place Topics and other platform mechanisms already demonstrate attribute-level extraction from user-generated material.

Different systems, however, have different access to sources and use different retrieval mechanisms.

The framework does not claim:

“If Coverage increases, an AI system will necessarily recommend the business.”

A narrower statement is:

a retrieval-based system can retrieve, compare, summarise, or cite only information that exists in sources available to that system.

Surface Distribution therefore matters: evidence present on one surface is not necessarily accessible to every other system.

A more complete public representation of an attribute creates a larger body of publicly available material concerning that attribute.

Whether a particular business is surfaced, cited, ranked, or recommended is a separate question.

28. Nearest Prior Work

Many components of the framework have direct predecessors.

ZMOT / UMOT describe the role of information and published customer experience in subsequent cycles of choice.

Reputation economics examines the accumulation of reputation and related economic mechanisms.

Electronic word-of-mouth research studies the digital transmission of customer information and feedback mechanisms.

Hu & Liu and subsequent aspect-based analysis have long analysed reviews at the feature level.

TrustYou, ReviewPro, and other hospitality systems group reviews into categories and measure mentions, sentiment, and trends.

Google Place Topics and related mechanisms extract attribute-level topics from user-generated text.

Whitespark has described practical approaches to developing weakly represented Place Topics.

Chen & Xie distinguish seller-created and buyer-created information.

Sparks, So & Bradley examined how public business responses affect prospective customers.

Carroll & McCombs examined the relationship between public attribute salience and corporate image.

Recoin formalised relative completeness through missing entity properties.

Evidence & Gap Maps formalised structured spaces of evidence and gaps in another domain.

Multi-platform reputation systems already use review spread, cross-source monitoring, and multi-platform aggregation.

Evan White / Evidence Marketing uses a contemporary macro-level vocabulary around evidence, public sources, reputation, and AI.

These are **prior work**, not objects of authorship claims in this Method Note.

29. The Proposed Distinction

No individual component below is claimed as a standalone invention.

The proposed contribution lies in their combination.

Compounding Public Evidence represents a specific business through a **Reference Attribute Inventory** of real or explicitly claimed properties.

Operational reality determines which properties exist.

Choice relevance determines which of them deserve priority.

This inventory is mapped against an external public evidence layer.

The minimum unit is an attribute-specific Evidence Unit with preserved provenance.

The framework then separately considers:

Coverage - which important properties have qualifying evidence at all;

Evidence Strength - how strongly each property is represented;

Public Evidence Gap - which important properties are absent or weakly represented;

Surface Distribution - where that evidence is accessible;

Public Evidence Dynamics - how the structure changes over time.

In compressed form, the proposed management object is:

**Reference Attribute Inventory x Choice Relevance x Public Evidence
Units x Provenance x Coverage / Strength / Gap x Surfaces x Time.**

This connected construct is the narrowest intellectual core of the framework.

30. Difference from Review Analytics

Review analytics may have sophisticated fixed taxonomies, identify zero-mention or low-mention categories, measure sentiment, mention counts, trends, and comparisons.

The distinction of Compounding Public Evidence therefore cannot be reduced to:

“Review analytics sees only what has already been written.”

The more precise boundary is different.

Review analytics without an external Reference Attribute Inventory cannot reliably distinguish between:

“this property does not exist in the business”

and

“this property exists in the business but is barely represented in the analysed public environment.”

Compounding Public Evidence first establishes a reference model of the business itself and only then maps it against Public Evidence.

For example, if a hotel actually has a casino, the Reference Attribute Inventory records:

Hotel -> Casino

regardless of whether the word casino appears anywhere in the review corpus.

Only then is the question asked:

what Public Evidence exists regarding this part of the business?

The external reference point turns an absence of evidence from a simple “zero mention count” into a potential Public Evidence Gap.

31. Difference from Reputation Management

Reputation is a broader resulting perception or evaluation of a business.

It may depend on numerous factors.

Public Evidence Structure sits logically **upstream of** overall reputation.

It describes not what the market ultimately thinks about a company, but the observable structure of public informational inputs from which some of those conclusions may be formed.

The framework does not propose a new definition of reputation.

It proposes a distinct management object:

the public evidentiary representation of specific business properties.

32. The Framework Is Not Limited to Reviews

Reviews are one of the most visible sources of Public Evidence, but the framework is broader than reviews.

Evidence may exist in:

- user-generated content;
- first-party structured information;

- public business responses;
- independent sources;
- different decision surfaces.

A change in the policy of one review platform should therefore not invalidate the framework itself.

Operational implementation may change.

Public Evidence Structure as an object remains.

33. Compliance Boundary

Compounding Public Evidence is based on real businesses and authentic public information.

The framework excludes fabricated reviews, impersonation, review gating, suppression of negative opinions, incentives conditioned on predetermined positive ratings, and other forms of artificial distortion of the public evidence picture.

Where law or platform policies impose restrictions on solicitation, incentives, disclosure, or use of user-generated content, those restrictions take precedence over commercial application of the framework.

Applications must take into account relevant consumer-review regulations and the policies of individual platforms.

Managing Public Evidence Structure does not create a right to interfere with independent customer opinion.

34. Measurement and Reproducibility

The separation of semantic judgement from measurement is fundamental.

Determining which entity or attribute a claim belongs to may require human or model-based semantic classification.

However, quantitative measures of Coverage, Strength, Surface Distribution, Dynamics, and comparisons should be calculated reproducibly from fixed source units.

Every Evidence Unit should remain linked to a verifiable fragment of its original source.

Automated measurement should include integrity checks for missing, added, or incorrectly mapped units.

Thus:

a model or human judges meaning; the deterministic layer calculates the result.

35. What the Framework Does Not Promise

Compounding Public Evidence does not guarantee a particular search position.

It does not guarantee inclusion in the recommendation of any specific AI system.

It does not guarantee a higher rating.

It does not guarantee a specific conversion rate.

It does not guarantee a number of new customers.

It does not guarantee revenue growth.

The framework works with an earlier and directly observable object:

how completely, strongly, and accessibly important business properties are represented by Public Evidence across relevant surfaces.

Commercial outcomes may be associated with this object, but they require separate measurement.

36. Testable Propositions

The framework generates several empirically testable directions.

First. Attribute-level Public Evidence Coverage may explain part of evaluation and choice that is not explained by rating and review volume alone.

Second. Important business properties may systematically exhibit unequal levels of public evidence.

Third. Evidence Strength may depend not only on quantity but also on recency, specificity, provenance, consistency, and accessibility.

Fourth. Public Evidence Dynamics may demonstrate measurable decay: older evidence may lose informational value even while remaining physically accessible.

Fifth. Surface Distribution may be associated with which parts of a Public Evidence Structure are accessible through different human decision paths and different retrieval systems.

Sixth. Part of the information generated through real customer experience does not enter the public environment; consequently, a Public Evidence Structure may differ substantially from the operational reality of a business even after a large number of completed customer experiences.

These are research propositions, not claims of established universal causality.

37. The Model in Short Form

Source of the public layer:

CUSTOMER EXPERIENCE

Observable Dynamics regimes:

COMPOUNDING
STAGNATING
DECAYING
CONTRADICTING

Operational procedures used in commercial applications to work with this structure are outside the scope of this Method Note.

38. The Central Question

A traditional reputation dashboard may begin by asking:

“What is our rating?”

Review analytics may ask:

“What are our customers talking about?”

Compounding Public Evidence starts with a different question:

“What exactly about our business is publicly evidenced - how strongly, where is it accessible, and what is missing from that picture?”

Before that comes one additional question:

“What actually exists in the business, and which of those properties genuinely matter to customer choice?”

Connecting these two questions links the operational reality of a business to the public information environment in which it is evaluated.

39. The Narrowest Definition of the Intellectual Contribution

The proposed framework treats the public information layer surrounding one business as a single management object whose unit is a public claim or observation concerning an attribute of a specific entity with preserved provenance.

This layer is mapped against a **Reference Attribute Inventory** of real or explicitly claimed business properties, prioritised according to their **choice relevance**.

This makes it possible to separately describe:

- breadth of public coverage;
- strength of evidence;
- visibility gaps;
- distribution of evidence across relevant decision surfaces;
- change in the structure over time.

The accumulation of reviews, the influence of previous experience on subsequent choice, attribute-level analysis, reputation capital, review-topic analytics, completeness analysis, multi-platform presence, and the public value of evidence are not claimed as discoveries of this framework.

40. Authorship and Status

Author of the conceptual framework: Dmitrii Markov.

The framework was developed in the course of building Elutio.

Elutio is the first commercial context in which the framework is being applied, while authorship of the conceptual formulation belongs to the author of this Method Note.

This text is:

Method Note 01 - Version 1.0, English Edition.

After public fixation, substantive changes should not be silently introduced into the published version.

They should be released as subsequent versions.

41. Use of Analytical Tools

Language models were used as analytical tools for structuring observations, searching for counterarguments, comparing the framework with prior work, and checking terminological consistency.

43. Core Principle

Every customer experience creates information about a business, but only part of that information becomes public and remains available to future buyers. Compounding Public Evidence enables a business to see how its important real properties are represented within this accumulated public layer: what is evidenced, how strongly, where it is accessible, where gaps exist, and how the evidence structure changes over time.
